

# COOLING FAN INSTALLATION INSTRUCTIONS

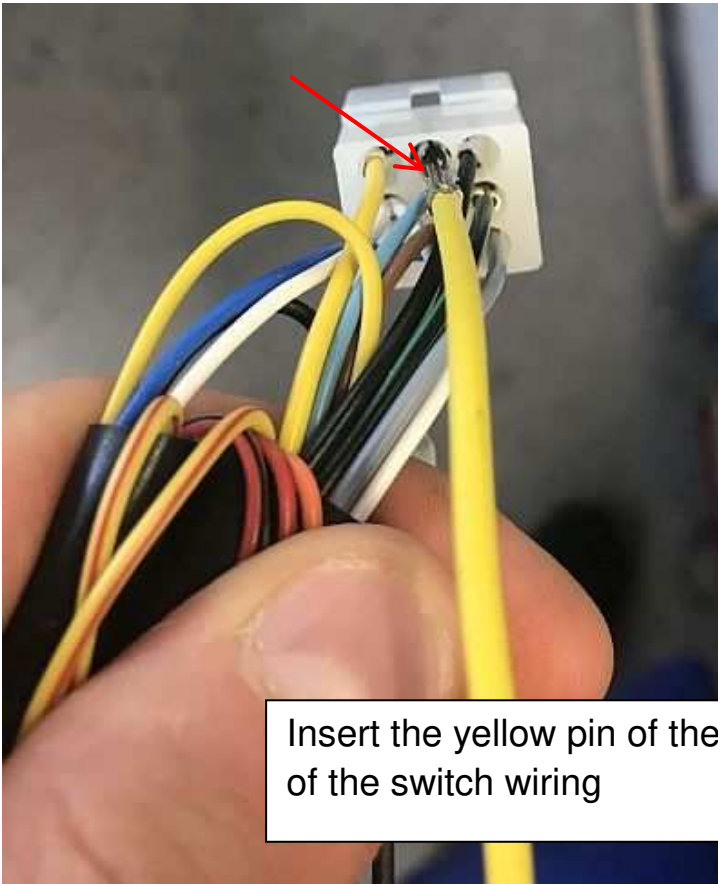

Put the fan on the rear part of the radiator, taking care to keep it as low as possible. It is recommended to fix the fan support with rivets; please be careful when drilling holes in the radiator trying to get down with the drill only a few millimeters, to not damage the radiator.

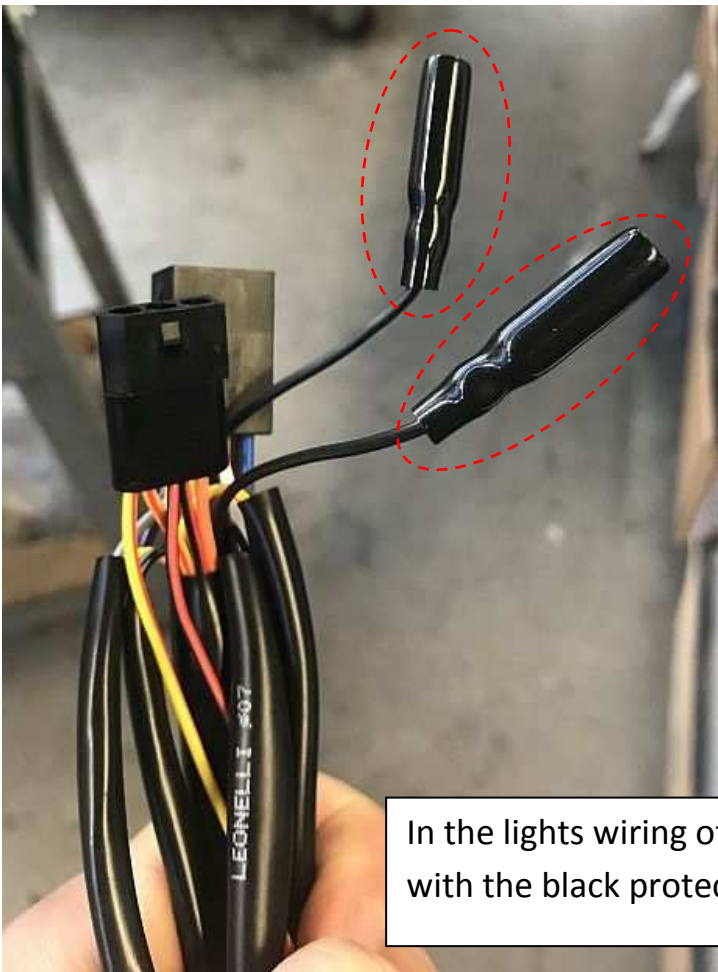

It is recommended to rotate the coil towards the rear of the motorcycle

On the wiring that connects the light switch to the rest of wiring there is an empty hole

Insert the yellow pin of the fan wiring into the empty hole of the switch wiring

In the lights wiring of the bike there are two black wires with the black protection cap

To power the fan connect the black wire of the light wiring with the fan black wire, and then connect the other end of the black wire of the fan wiring to the pin that was inserted in the light wiring
